Ways to use variables in the selects. Please note the difference between text and numbers.
The commented out code is to show other ways that could have accomplished the outcome.
I was originally planning to use the structure.
I will display the DDriveName and when I select
I will get the ValueMember DDriveNo.
Set up a new record and then fill it and then the Add adds the record to the local record set. To actually change the physical database I need to use the Update.

The selected value which is DDIdno will be move to the textbox.
This is the record I added using the program that adds donations.
I changed the middle initial of David Anders and added record 5840.
The change was just changing what was a M to a T.

Binding the data to the text fields.
Add a record to the local database

Update the physical database.
